Research Interests

I am poised to make an impact to improve water quality in streams, rivers and lakes by improving ways we design and manage *treatment systems* in agricultural and urban settings. *Treatment systems* are systems that intercept ground- and surface waters on their way to receiving water bodies. Until now, my team's study treatment systems have included soils, riparian zones, streams, wetlands, and denitrification beds. Treatment systems are still very much treated as 'blackbox' reactors which hinders our ability to improve their design and maintenance.

I believe that a prerequisite to improve treatment efficiency is to 'look inside the blackbox' and largely enhance our understanding and quantification of the internal functioning of treatment systems. My team's core method is the deployment and adaptation of newly available continuous water quality sensors to obtain concentration data at a high resolution in space *and* in time.

My team is exploring the possibility to, and the conditions for, use *water quality rating curves* with these sensors, particularly to difficult-to-measure pollutants and nutrients. We are expanding the capabilities to *resolution in space* of these instruments by fitting them with sequential autosamplers, allowing to obtain high resolution data both in space *and* in time. We also use this technology to explore the biogeochemical functioning at the watershed scale and to calculate uncertainties on nutrient loads.
